

Get a Diagnostics Snapshot with Rule Tool in PowerTrack

The Rule Tool provides comprehensive on-demand reports for system health. Users can perform real-time queries for key indicators from each site associated with the user profile. The survey covers 20 unique queries across four areas of operation: communication, configuration, data, and performance.

- Verify that all devices are operational and reporting
- Verify that all software settings are valid
- Verify that all data appears healthy
- Verify that systems are performing within anticipated benchmark levels
- Streamline system commissioning
- Troubleshoot reporting errors
- Empower remote diagnosis for system issues, saving time in the field

If users find any results calling for deeper investigation, they can open the details tab for any system to see complete results and explanations for the performed survey.

If any further action is required, users can click through to site detail page views, or to work order creation (with CMMS integration).

The Rule Tool is a standard feature for all PowerTrack users. Find the Rule Tool in left column navigation from any web page in PowerTrack.

We recommend that all PowerTrack users conduct regular Rule Tool surveys for ongoing oversight of their AlsoEnergy systems.
